Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 87; Page 73; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin insulence as on pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM

results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, promagneasemia, polycythaemia, hypocalcaemia, promagneasemia, polycythaemia, hypocalcaemia, promagneasemia, polycythaemia, hypocalcaemia, polycythaemia, polyceptilitubinaemia, and subsequent childhood and adolescent obserty. Exendin-a) and the Mexican beaded alizard (exendin-a) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for ont cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional content and prolonged effect on blood glucose, and, unlike conventional menty should not cause weight gain, as they inhibit gastric emptying and reduce appetite. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 77; Page 68; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistence and a diminished ability to insulin resistence and insulin resentance. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the fectus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of fectal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Bereadins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 72; Page 65; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of focetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, such as hypomagnessemia, polycythaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contrained for GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to combination of increased insulin secretion increase. GND pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM centils in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypocalcaemia, hypomagnessemia, polycythaemia, or hyperbilitubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraind therapy, should not cause weight gain, as they inhibit gastric misulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin cannot to the invention which is based upon the sequence of exendin-4). Example 69; Page 64; 133pp; English

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 70; Page 64; 133pp; English.

The invention relates to the use of an exeminal (whostole property) and is due to exemnal against (AAB64185-B64368) for treating preparaty, and is due to exemnal against (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are sesociated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive consists in an elevated rate of foetal abnormalities such as neural tube results in an elevated rate of foetal abnormalities such as neural tube cord is associated with an increased risk of meonatal morbidites cuch as hypoglycaemia, hypomagnesaemia, polycythaemia, such as hypoglycaemia, hypomagnesaemia, polycythaemia, byperbilitubinaemia, and subsequent childhood and adolescent obesity.

CC Exendins are peptides from the salivary secretions of the gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit the complexy with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with severe prolonged hypoglycaemia in the newborn. They have a contraindicated for companying and reduce appetite. The present sequence represents a exendin is based to trave weight gain, as they inhibit gastric insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence of exendin-4 agonist of the invention which is based upon the sequence of exendin-4. invention relates to the use of an exendin (AAB64181-B64182) or an

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB6485-B64368) for treating gestational diabetes malitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increase insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancias are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampata, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessenia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-1) and the Mexican beaded lizard (exendin-2) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for one cause severe prolonged bygolycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional computing and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4 agonist of the present sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                           Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB64254 Length: 32 February 4, 2005 13:32 Type: P Check: 25 Found using 'seq5' (mohamed337.key)

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

Example 68; Page 64; 133pp; English.

especially in a human.

```
cendin agonist (AAB64185-B64368) for treating gestational diabetes
exendin agonist (AAB64185-B64368) for treating gestational diabetes
combination of increased insulin resistance and a diminiabled ability to
combination of increased insulin secretion increase. GMD pregnancy, both
insulin resistance and insulin secretion increase. GMD pregnancies are
associated with complications in both the mother and the foetus. Women
with GDM have increased rates of Caesarian delivery, hypertensive
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
defects, and is associated with an increased risk of neonatal morbidites
compounds in hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia,
hyperbilirubinaemia, and subsequent childhood and adolescent obesity.
Exendins are peptides from the salivary secretions of the Gila monster
compounds used to treat type 2 diabetes, which are contraindicated for
compounds used to treat type 2 diabetes, which are contraindicated for
GDM, exendins and exendin agonists do not cross the placenta and thus do
contrained the effect on blood glucose, and, unlike conventional
insulin therapy, should not cause weight gain, as they inhibit gastric
compounds used caffect on blood glucose, and, unlike conventional
insulin therapy, should not cause weight gain, as they inhibit gastric
compounds of the invention which is based upon the sequence of exendin-4

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes constraints (GDW) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancis are insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive clisorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, polycythaemia, hyporalcaemia, polycythaemia, hyporalcaemia, polycythaemia, hyporalcaemia, polycythaemia, hypomagnesemia, polycythaemia, polycythaemia, and subsequent hildhood and adolescent obsity, particularly GLP-1, and have similar insulintropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used effect on blood glucose, and, unlike conventional interapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin
                                                                                                                                                                                                                                                                                                                                                                          Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 65; Page 62; 133pp; English

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

Heloderma suspectum

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminible ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Gesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM celects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, such as hypoglycaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, polycythaemia, and subsequent childhood and adolescent obesity. Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cross the placenta and thus do not cross the placent and the and placent and the means and places. And in the newborn in the placenta and thus and contraind of feet on places. and in like conventional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAB64253 Length: 33 February 4, 2005 13:32 Type: P Check: 2325 Found using 'seq5' (mohamed337.key)

the invention features to the use of an exemuni (Aubsals) of an exemula agonist (Adb64185-B64366) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased lisk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporabilirubinaemia, and subsequent childhood and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agoniats do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contraindire conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-gaonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the use of an exendin (AAB64181-B64182) or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 63; Page 61; 133pp; English.

AAB64251 standard; peptide; 34 AA Exendin agonist, SEQ ID NO:71. 27-MAR-2001 (first entry) AAB64251;

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

Heloderma suspectum Synthetic

WO200073331-A2.

```
Exendin agonist (AAB64185-B64368) for treating gestational diabetes

cxendin agonist (AAB64185-B64368) for treating gestational diabetes

cxendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a

cxendination of increased insulin resistance and a diminished ability to

cxendinar resistance and insulin secretion increase. GNB pregnancies are

associated with complications in both the mother and the foctus. Women

cxell for an an elevated rate of Caesarian delivery, hypertensive

disorders such as pre-eclampsia, and urinary tract infections. GDM

results in an elevated rate of foctal abnormalities such as neural tube

cxells in an elevated rate of foctal abnormalities such as neural tube

cxells as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia,

cxells as hypoglycaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the G1a monster

(exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candline (CC exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GNM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive cisorders such as pre-clampsis, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypomagnesemia, polycythaemia, chypczblirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4 emptying and reduce appetite. The passed upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                             Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB64248 Length: 35 February 4, 2005 13:32 Type: P Check: 7453 Found using 'seq5' (mohamed337.key)

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes compliated (DW arises during pregnancy, and is due to a combination of increased insulin secretion. In contrast, in a normal pregnancy, both insulin resistence and insulin secretion increase. GW pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive caisorders such as pre-eclampsia, and unimary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypomagnessemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contrainficated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglyceemia in the newborn. They have a contrainficated for compounds used to treat type 2 diabetes, which are contrainficated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycemia in the newborn. They have a coptent and reduce appetite. The present sequence represents a exendin empaying and reduce appetite. The present sequence represents a exendin-quirtying and reduce appetite. The present sequence represents a exendin-quirtying and reduce appetite. The present sequence of exendin-quirtying and reduce appetite. The present sequence of exendin-quirtying and reduce appetite and prolong the sequence of exendin-

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64188-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin receistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive alsorders such as pre-clampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube cauch as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycytheemia, hypomagnesemia, polycytheemia, hypomagnesemia, polycytheemia, hypomagnesemia, polycytheemia, hypomagnesemia, moster childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which sevarial members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindiated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example. 60; Page 60; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tubes defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, convendin are peptides from the salivary secretions of the dia monster (exendin-4) and the Mexican beaded lizard (exendin-8) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypodlycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDW) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast. Only pregnancies are insulin resistance and diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cresults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polychaemia, howelded lisard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional polycent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence of exendin-4 gaonist of the invention which is based upon the sequence of exendin-4 Example 57; Page 58; 133pp; English. especially in a human.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

The invention relates to the use of an exendin (Anabaltels 1912) or an exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin resistance and insulin secretion in contrast, in a normal pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube disorders und is associated with an increased risk of meonatal morbidites such as hypoglycaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Glum monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to tract type 2 diabetes, which are contraindicated for CDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy; should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 invention relates to the use of an exendin (AAB64181-B64182) or an Sequence 38 AA; %X5555555555555555555555555555555555

Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 hyperbilirubinaemia, and subsequent childhood and adolescent obesity. 888888888888888888

exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube The invention relates to the use of an exendin (AAB64181-B64182) or an

defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, nypomagnesemia, polycythaemia, hyporalcaemia, nor hypomagnesemia, polycythaemia, chyperbilitubinaemia, and subsequent childhood and adolescent obesity.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and adminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancies are associated with complications in both the mother and the focus. Women with GDW have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDW results in an alevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypothilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family,
GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

especially in a human.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mailitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnesaemia, polycythaemia, hypomagnesaemia, and subsequent childhood and adolescent observer. homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 43; Page 51; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agoniet (AAB64185-B64368) for treating gestational diabetes candin agoniet (AAB64185-B64368) for treating gestational diabetes candination of increased insulin resistance and adminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Gestarian delivery, hypertensive with GDM have increased rates of foetal abnormalities such as neural tube cesults in an elevated with an increased risk of neonatal morbidites centured as a speciated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, companial and subsequent childhood and adolescent obesity. The exendines are peptides from the salivary secretions of the Gila monster (exendin-4) and the Maxican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family. Compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglyceemia in the newborn. They have a contraindicated for potent and prolonged effect on blood glucose, and, unlike conventional companist of the invention which is based upon the sequence of exendin-agonist of the sequence of ex

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 40; Page 50; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and adminished ability to increase insulin resistance and adminished ability to increase insulin resistance and insulin secretion. In cornerase. GDM pregnancies are associated with complications in both the mother and the foetus. Women, with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an a elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporalcaemia, hypomagnesaemia, polycythaemia, hypothilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinorropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for ontern and any ever proclonged hypoglycaemia in the newborn. They have a contraint and world and allowed to the place of the place of the contraindicated for not cause severe proclonged hypoglycaemia in the newborn. They have a contraint and world and allowed to the place of the place of the contraindicated for not cause severe proclonged hypoglycaemia in the newborn and thus do not cause severe proclonged hypoglycaemia in the newborn and thus and accounts and eventine and thus and thus and the severe proclonged hypoglycaemia in the newborn and the place of the contraindicated for the contraints of the place of the contraints of the cont potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

```

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cincrease insulin secretion increase. GMD pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-clampsia, and unimary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporapasesemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Maxican beaded lizard (exendin-3) which several members of the glucagon-like peptide family. homology with several members of the glucagon-like peptide family. COMPW, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contenting the terapy, should not cause weight gain, as they hibbit ascendin-qualint therapy, should not cause weight gain, as they hibbit agonist of the invention which is based upon the sequence of exendin-qualin

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistence and a diminished ability to increase insulin resistence and a forest of the contract of increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as speciated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypocralcaemia, hypocralcaemia, poperational, hypocralcaemia, hypocralcaemia, hypocralcaemia, hypocralcaemia, hyporphilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-1) and the Mexican beaded lizard (exendin-3) which exhibit homeology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinctropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to reat type 2 diabetes, which are contraindicated for off, exendin and exendin agoniste of not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 37; Page 48; 133pp; English

combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocraclaemia, hypomagnesemia, polycythaemia, hyporalinubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindiated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional consults and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 35; Page 47; 133pp; English.

cc exandin agonist (AAB64185-B64368) for treating gestational diabetes
cxendin agonist (AAB64185-B64368) for treating gestational diabetes
cxendin agonist (AAB64185-B64368) for treating pregnancy, and is due to
combination of increased insulin resistance and a diminished ability to
combination of increased insulin secretion increase. GND pregnancis a are
insulin resistance and insulin secretion increase. GND pregnancis as
sasociated with complications in both the mother and the foetus. Women
with GDM have increased rates of Caesarian delivery, hypertensive
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
cedetts, and is associated with an increased risk of neonatal morbidites
cush shypoglycaemia, hypocalcaemia, polycythemia,
hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Cc secondin a na the wextran beaded lizard (exendin-3) which exhibit
compounds used to treat type 2 diabetes, which are contraindicated for
compounds used to treat type 2 diabetes, which are contraindicated for
GNM, exendins and exendin agonists do not cross the placenta and thus do
not cause severe prolonged hypoglycaemia in the newborn. They have a
contraind reduce appetite. The present sequence represents a exendin
cinsulin therapy, should not cause weight gain, as they inhibit gastric
agonist of the invention which is based upon the sequence fexendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both associated with complications in both the mother and the focus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of focetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypotalirubinaemia, and subsequent childhood and adolescent obesity. Reardins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GiP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for on to cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                    Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB64219 Length: 39 February 4, 2005 13:32 Type: P Check: 7221 Found using 'seq5' (mohamed337.key)

combination relates to the use of an exendin (AABGSHSI-TobalEs) or an exendin agonist (AABGSHSE) for treadtional diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cincrease insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cresults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, compounds are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a computing and reduce appetite. The present sequence represents a specifically claimed exendin agonist, which is based upon the sequence of searching and reduce appetite. The present sequence represents a
Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin resistence and insulin secretion increase. GDM pregnancis are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the cila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinctropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged bypoglycaenia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional intention which is based upon the sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           February 4, 2005 13:32 Type: P Check: 7660
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HGEGTFTSDLSKQMEEEAVRLPIEWLKNGGASSGAAAAS

```
candin agonist (AAB64185-B64368) for treating pestational diabetes
mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to
combination of increased insulin resistance and a diminished ability to
increase insulin secretion. In contrast, in a normal pregnancy, both
insulin resistance and insulin secretion increase. GDM pregnancy, both
insulin resistance and insulin secretion increase. GDM pregnancy, both
insulin resistance and insulin secretion increase. GDM pregnancy women
with GDM have increased rates of Caesarian delivery, hypertensive
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foetal abnormalities such as neural tube
defects, and is associated with an increased risk of meonacial morbidites
such as hypoglycaemia, hypochagnesaemia, polycythaemia,
hyperbilirubinaemia, and subsequent childhood and adolescent obesity.
Exendins are peptides from the salivary secretions of the Gila monster
(exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
homology with several members of the glucagon-like peptide family,
particularly GIP-1, and have similar insulinotropic effects. Unlike the
compounds used to treat type 2 diabetes, which are contraindicated for
GDM, exendins and exendin agonists do not cross the placenta and thus do
not cause severe prolonged hypoglycaemia in the newborn. They have a
potent and prolonged effect on blood glucose, and, unlike conventional
computing and reduce appetite. The present sequence represents a exendin-
emptying and reduce appetite. The present sequence of exendin-4
agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB64218 Length: 39 February 4, 2005 13:32 Type: P Check: 8125

such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Berendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistence and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-clampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites
                                                                                                                                                                                                                                                           Example 26; Fig 1B; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating pregnancy, and is due to a callitus (GDM) in a patient. GDM arises during pregnancy, not increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-edlampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypedycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-1) which exhibit homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and brolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-gaonist of the invention which is based upon the sequence of exendin-9
                                                                                                                                                                         Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                             Example 24; Fig 1B; 133pp; English

The invention relates to the use of an exemular (Arabathara Formal diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both cincreased insulin secretion increase. GDM pregnancies are insulin resistance and insulin secretion increase. GDM pregnancies are sescrited with complications in both the mother and the foetus. Women with GDM have increased rates of Gessarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM centured in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of meonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, compounds are peptides from the salvary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, particularly GIP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged ffect on blood glucose, and, unlike conventional contraint therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4 agonist to the sequence of exendin-4 agonist of the envention which is based upon the sequence of exendin-4 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, invention relates to the use of an exendin (AAB64181-B64182) Example 25; Fig 1B; 133pp; English. 99US-00323867. exendin agonist (AAB64185-B64368) for treating gestational diabetes
exendin agonist (AAB64185-B64368) for treating gestational diabetes
mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to
combination of increased insulin resistance and a diminished ability to
increase insulin secretion. In contrast, in a normal pregnancy, both
cinsulin resistance and insulin secretion increase. GDM pregnancies are
associated with complications in both the mother and the foctus. Women
with GDM have increased rates of Caesarian delivery, hypertensive
disorders such as pre-eclampsia, and urinary tract infections. GDM
results in an elevated rate of foctal abnormalities such as neural tube
defects, and is associated with an increased risk of neonatal morbidites
such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia,
hyperbilirubinaemia, and subsequent childhood and adolescent obesity.
Exendine are peptides from the salivary secretions of the Gla monster
(exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
bomology with several members of the glucagon-like peptide family,
particularly GLP-1, and have similar insulinotropic effects. Unlike the
compounds used to treat type 2 diabetes, which are contraindicated for
GDM, exendins and exendin agonists do not cross the placenta and thus do
not cause severe prolonged hypoglycaemia in the newborn. They have a
potent and prolonged effect on blood glucose, and, unlike conventional
insulin therapy, should not cause weight gain, as they inhibit gastric
emptying and reduce appetite. The present sequence represents a exendin-
                                                                                   Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

exendin agonists for lowering or reducing blood treating gestational diabetes mellitus in a subject, Use of exendins or exe glucose levels and tre especially in a human.

Example 23; Fig 1B; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candina agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and almulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive associated with complications in both the mother and the foetus. Women of disorders such as pre-eclampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube of sociated with an increased risk of neonatal morbidites cauch as hypoglycaemia, hypomagnesemia, polycythaemia, hypomagnesemia, polycythaemia, hypomagnesemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster of exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for CDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emprying and reduce appetite. The present sequence of exendin-4 cause weight gain, as they inhibit gastric emprying and reduce appetite. The based upon the sequence of exendin-4.

Use of exendins or exendin agonists for lowering or reducing blood glucose, levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 16; Fig 1B; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to

such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendina are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendina and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendir agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Gessarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cresults in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, byporalcaemia, hypomagnesaemia, polycythaemia, contina are peptides from the salivary secretions of the Gila monster exendines are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cross the placenta and thus do not cross the placent and prolonged effect on blood glucose, and, unlike conventional computing and reduce appetite. combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDW) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancies are insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regulates in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, polycaemia, polycaemia, hypomagnessenia, polycythaemia, not compounds used to treat type 2 diabetes, which are contraindicated for GDM, particularly GLD-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes condination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion. In contrast, in a normal pregnancy, both increase insulin secretion increase. GMV pregnancise are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cesearian delivery, hypertensive with GDM have increased rate of foetal abnormalities such as neural tube cesults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnasemia, polycythaemia, hyporalcaemia, polycythaemia, cesuch as hypoglycaemia, polycythaemia, hyporalcaemia, polycythaemia, hyporalcaemia, polycythaemia, cesuch as hypoglycaemia, polycythaemia, hombeque in morbidity cesuch and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are period of the diapenies of the glucagon-like population and exendin agonies of exendin as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence of exendin-4 emptying and reduce appetite is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                   Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of exendins or exendin agonists for lowering or reducing blood
glucose levels and treating gestational diabetes mellitus in a subject,
                                                            to: 39

```

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GND pregnancies are associated with compilcations in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, byperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster (exendins are peptides from the salivary secretions of the exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agoniets do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a specifically claimed exendin agonist, which is based upon the sequence of

combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin secretion increase. GDM pregnancise are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporagnessemia, polycythaemia, hyporagnessemia, polycythaemia, hyporagnessemia, polycythaemia, hypomagnessemia, polycythaemia, polycomia, used to treat type 2 diabetes, which are contraindicated for components used to treat type 2 diabetes, which are contraindicated for components used to treat type 2 diabetes, which are contraindicated for components and prolonged effect on blood glucose, and, unlike conventional polycy appring and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes medilitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both casociated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-clampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tubes defects, and is associated with an increased risk of neonatal morbidites uch as hypogyrosemia, hypocalcaemia, hypomagnesemia, polycythaemia, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several hypoglycaemia in the newborn. They have a compounds used to treat type 2 diabetes, which are contraining and exendin agonist, which is based upon the sequence of emptying and reduce appetite. The prosent sequence represents a potent empty adone appetite. The proses, and, unlike conventional insulin therapy, should not cause weight gain, as they

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Disclosure; Page 13; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B61868) for treating gestational diabetes mallitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Gaesarian delivery, hypertensive disorders such as pre-eclampsia, and urlnary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube cells. And subsequent childhood and adolescent obssity.

The peptides from the salivary secretions of the Gila monster (exendin a med the Mexican beaded lizard (exendin-3) which exhibit chomology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypolycaemia in the newborn. They have a contraind and severe prolonged hypolycaemia in the newborn. They have potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendia agonist of the invention which is based upon the sequence of exendin-4

Evaluating beta-cell secretory capacity and responsiveness to glucose, useful for diagnosing impaired glucose tolerance and diabetes, comprises employing glucagon-like-peptide-1 as a diagnostic test to determine beta-

The invention relates to a new method for evaluating beta-cell secretory capacity in an individual, or responsiveness of a beta-cell to glucose, comprising the administration of glucose and glucagon.like peptide-1 (GLP -1) or its biologically active analogues. The response in the individual constraint is then measured against the standard response of a healthy individual to determine if the individual has impaired beta-cell function. The method is particularly useful for diagnosing impaired glucose tolerance (IGT) and non-insulin-dependent (type II) diabetes. The method is a rapid test of beta-cell function, which is a marker for impaired glucose tolerance. Unlike prior methods, the method is reliable and without significant adverse side effects and/or patient pain and discomborator. The method also provides information about insulin secretory capacity, and is easy and represente a prior reproducible. The present sequence represents a Gila monster venom GLP-1 analogue peptide referred to in the disclosure of the invention

The invention relates to modified insulinotropic peptides (irle), or derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or thiol groups on blood components (e.g., esrum albumin) to form a stable covalent bond. The insulinotropic peptides of the invention are derivatives of glucagon-like peptide 1 (GLP -1) or exendin and contain a reactive group such as a maleimido group or a succinimidyl group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a peptide of the invention is useful for treating diabetes, paticularly type of the treatment of nervous system disorders including anxiety, psychosis, seizures, panic attacks, hysteria and sleep disorders; to induce an anxiolytic effect on the central nervous system (CNS); to activate the anxiolytic effect on the central nervous system (CNS); to activate the carcillett and as a treatment for insulin resistance, particularly that which occurs after certain types of surgery. The conjugation of a peptide of the invention to a blood component via the reactive group provides increased stability in the presence of peptidaess. The peptides of the invention therefore have a longer in vivo. half-life as they are less susceptible to proteolytic degradation. The present sequence represents in insulinotropic peptide of the invention
                                                                                                                                                                                                                                      /note= "Side chain is linked to a maleimidopropionic acid (MPA) moiety, optionally via two AEEA ([2-(2-amino)ethoxy]ethoxy acetic acid) linking groups"

The invention relates to a new method for evaluating beta-cell secretory capacity in an individual, or responsiveness of a beta-cell to glucose, comprising the administration of glucose and glucagon-like peptide-1 (GLP -1) or its biologically active analogues. The response in the individual cast then measured against the standard response of a healthy individual to determine if the individual has impaired beta-cell function. The method is particularly useful for diagnosing impaired glucose tolerance (IGT) and non-insulin-dependent (type II) diabetes. The method is a rapid test of beta-cell function, which is a marker for impaired glucose tolerance. Unlike prior methods, the method is reliable and without significant adverse side effects and/or patient pain and discomfort. The method also provides information about insulin secretory capacity, and is easy and reproducible. The present sequence represents a Gila monster venom GLP-1 analogue peptide referred to in the disclosure of the invention Evaluating beta-cell secretory capacity and responsiveness to glucose, useful for diagnosing impaired glucose tolerance and diabetes, comprises employing glucagon-like-peptide-1 as a diagnostic test to determine betacell function. Exendin 3; Gila monster venom; GLP-1 analogue; glucagon-1ike peptide-1; type II diabetes; non-insulin dependent diabetes mellitus; NIDDM; beta-cell function; secretory capacity; impaired glucose tolerance; IGT; beta-cell stimulatory test; diagnostic test; insulinotropic. ```
derivatives thereof which comprise a reactive group which reacts with derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or thiol groups on blood components (e.g., serum albumin) to form a stable covalent bond. The insulinotropic peptides of the invention are derivatives of glucagon-like peptide 1 (GIP or a succinimidyl group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a succinimidyl group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a type II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders including anxiety, psychosis, cype II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders; includice and anxiolytic effect on the central nervous system (CNS); to activate the constolytic effect on the central nervous system (CNS); to activate the constolytic effect on the central nervous system (CNS); to activate the constolytic effect on the central nervous system (CNS); to activate the confidence of the invention to a blood component via the reactive group provides increased stability in the presence of peptidaess. The peptides of the invention therefore have a longer in vivo. half-life as they are less susceptible to proteolytic degradation. The present sequence represents
                                                                                 /note= "Side chain is linked to a maleimidopropionic acid (MPA) moiety, optionally via two AEEA {[2-{2-amino}ethoxy]ethoxy acetic acid) linking groups"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel modified insulinotropic peptides for treating diabetes, nervous system disorders and for post surgery treatment, has reactive groups which react with amino, hydroxy or thiol groups on blood components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB48822 Length: 40 February 4, 2005 13:32 Type: P Check: 2570 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to modified insulinderoptic peptides (1178), or derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or thiol groups on blood components (e.g., serum albumin) to form a stable covalent bond. The insulinderopic competides of the invention are derivatives of glucagon-like peptide 1 (GLP -1) or exendin and contain a reactive group such as a maleimido group or a succinimidyl group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a peptide of the invention is useful for treating diabetes, paticularly type II (maturity onset) diabetes. It is also useful as sedative; for type II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders including anxiety, psychosis, seizures, panic attacks, hysteria and sleep disorders; to induce an anxiolytic effect on the central nervous system (CNS); to activate the carcilytic effect on the central nervous system (CNS); to activate the carcolopy; and as a treatment for insulin resistence, particularly that which occurs after certain types of surgery. The conjugation of a peptide of the invention to a blood component via the reactive group provides increased stability in the presence of peptidaese. The peptides of the invention therefore have a longer in vivo. half-life as they are less susceptible to proteolytic degradation. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insulinotropic peptide; insulin production; GLP-1 derivative; glucagon-like peptide 1; exendin derivative; reactive group; peptidase stabilisation; blood protein; conjugation; type II diabetes; insulin resistance; nervous system disorder; sedative; anxiolytic; antidiabetic; neuroprotective; tranquiliser; anticonvulsant.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel modified insulinotropic peptides for treating diabetes, nervous system disorders and for post surgery treatment, has reactive groups which react with amino, hydroxy or thiol groups on blood components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invention relates to modified insulinotropic peptides (ITPs), or

The invention relates to modified insulinotropic peptides (ITPB), or derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or thiol groups on blood components (e.g., erum albumin) to form a stable covalent bond. The insulinotropic peptides of the invention are derivatives of glucagon-like peptide 1 (GLP 1) or exendin and contain a reactive group such as a maleimide group or a succinimidal group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a succinimidal group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a peptide of the invention is useful for treating diabetes, particularly type II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders including anxiety, psychosis, seizures, panic attacks, hysteria and sleep disorders; to induce an anxiolytic effect on the central nervous system (CNS); to activate the CNS for the treatment of disorders such as depression, memory loss and narcolepsy; and as a treatment for insulin resistance, particularly that which occurs after certain types of surgery. The conjugation of a peptide of the invention to a blood component via the reactive group provides increased stability in the presence of peptidases. The peptides of the invention therefore have a longer in vivo. half-life as they are less unsceptible to proteolytic degradation. The present sequence represents an insulinotropic peptide referred to in the disclosure of the invention
                                                                                                                                                                                                                                                                                  Novel modified insulinotropic peptides for treating diabetes, nervous system disorders and for post surgery treatment, has reactive groups which react with amino, hydroxy or thiol groups on blood components.

The invention relates to modified insulinotropic peptides (ITPB), or derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or blood components (e.g., serum albumin) to form a stable covalent bond. The insulinotropic peptides of the invention are derivatives of glucagon-like peptide 1 (GLP 1) or exendin and contain a reactive group such as a maleimido group or a succinimidyl group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a succinimidyl group. The peptides of the invention of insulin. A composition comprising a septide of the invention is useful for treating diabetes, paticularly type II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders including anxiety, psychosis, the treatment of anxiots, hysteria and sleep disorders; to induce an anxiolytic effect on the central nervous system (CNS); to activate the consiolytic effect on the central nervous system (CNS); to activate the consiolytic effect on the central nervous system (CNS); to activate the anxiolytic offect on the central nervous system (CNS); to activate the consiolation to a blood component via the reactive group provides increased stability in the presence of peptidases. The peptides of the invention to a blood component via the reactive group provides increased stability in the presence of peptidases. The peptides of the invention the procedytic degradation. The present sequence represents an insulinotropic peptide of the invention
                                                                                                                                                                                                                                                                                                                                 Novel modified insulinotropic peptides for treating diabetes, nervous system disorders and for post surgery treatment, has reactive groups which react with amino, hydroxy or thiol groups on blood components.

                                                                                                                                                                                                           The present invention describes metabolic intervention with GLP-1 which improves the function of ischaemic and reperfused tissue. The method for amelioration of organ tissue caused by reperfusion of blood flow following a period of ischaemia comprises administering a composition including a compound which binds to a receptor for glucagon-like peptide-1 (GLP-1), in a carrier. Also described are: (1) a method of metabolic intervention with GLP-1 to improve the function of ischaemic and reperfused tissue, the method comprising administering a composition comprising GLP-1 in a carrier, and (2) a composition for use in the metabolic intervention with GLP-1 as above. The method is useful after surgical procedures selected from cardiac surgical procedures, organ transplants, traumatic limb amputation and reattachment, a ischaemic reperfusion event concurrent with gut infarct and myocardial infarct and improves the function of ischaemic and reperfused tissues. The method is devoid of side effects associated with current procedures. Antigenic and improves the representes a Glam monster venom peptide which is homologous to compare the present invention of the present invention

berum a browning to form a scable covatent bond. The limitinforopic peptides of the invention are derivatives of glucagon-like peptide 1 (GLP correction and contain a reactive group such as a maleimide group or a succilimidy! Group. The peptides of the invention act by stimulating the synthesis or expression of insulin. A composition comprising a peptide of the invention is useful for treating diabetes, paticularly crype II (maturity onset) diabetes. It is also useful as a sedative; for the treatment of nervous system disorders including anxiety, psychosis, seizures, panic attacks, hysteria and sleep disorders; to induce an anxiolytic effect on the central nervous system (CNS) to activate the CNS for the treatment of disorders such as depression, memory loss and narcolepsy; and as a treatment for insulin resistance, particularly that contrastic to a blood component via the reactive group provides increased stability in the presence of peptidases. The peptides of the invention to a blood component via the reactive group provides invention therefore have a longer in vivo. half-life as they are less susceptible to protecolytic degradation. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to modified insulinotropic peptides (ITPs), or derivatives thereof which comprise a reactive group which reacts with amino groups, hydroxyl groups or thiol groups on blood components (e.g., serum albumin) to form a stable covalent bond. The insulinotropic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diabetes;
                                                                                                                                                                                                                                                                                Novel modified insulinotropic peptides for treating diabetes, nervous system disorders and for post surgery treatment, has reactive groups which react with amino, hydroxy or thiol groups on blood components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Insulinotropic peptide; insulin production, GLP-1 derivative, glucagon-like peptide 1; exendin derivative; reactive group; peptidaes etabilisation; blood protein; conjugation; type II diabel insulin resistance; nervous system disorder; sedative; anxiolytic; antidiabetic; neuroprotective; tranquiliser; anticonvulsant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Type: P Check: 9591

 tissue injury caused by reperfusion of blood flow comprising administering a composition including a compound which binds to a daministering a composition including a compound which binds to a administering a composition including a compound which binds to a creeptor for glucagon-like peptide-1 (GLP-1), in a pharmaceutical carrier. The method is used for matabolism tissue injury caused by reperfusion of blood flow following a period of ischaemia. Growsed by reperfusion of blood flow following a period of ischaemic and reperfused brain cells. It treats patients after an acute stroke or haemorrhage and tissue damage arising from a medical procedure that is an expertused brain calls. It treats printiples or a medical procedure involving a reperfusion event. GLP-1 is an ideal alternative to insulin for the treatment of stroke as it stimulates endogenous insulin secretion to the presence of normo- to hyperglycaemia but not during hypoglycaemia, the presence of normo- to hyperglycaemia but not during hypoglycaemia, the chancing insulin effectiveness by suppressing glucagon and maintains equiporacent sequence represents a Glia monster venom peptide which is the present sequence represents a Glia monster venom peptide which is the present and is given in the exemplification of the present
                                                                                                                                         A method for amelioration of brain tissue injury comprises administering a composition including a compound which binds to a receptor for glucagon -like peptide-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glucagon-like peptide-1; GLP-1; GLP-2; metabolic intervention; ischaemia; repeffusion; surgical procedure; cardiac surgical procedure; organ transplant; traumatic limb amputation; limb reattachment; ischaemic reperfusion; gut infarct; myocardial infarct.
                                                                                                                                                                                                                             The present invention describes a method for the amelioration of brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB36421 Length: 39 February 4, 2005 13:32 Type: P Check: 9570 ound using 'seq5' (mohamed337.key)

The present invention describes metabolic intervention with GLP-1 which improves the function of ischaemic and reperfused tissue. The method for ameliotation of organ tissue caused by reperfusion of blood flow following a period of ischaemic acomprises administering a composition including a compound which binds to a receptor for glucagon-like peptide-I (GLP-1), in a carrier. Also described are: (1) a method of metabolic intervention with GLP-1 to improve the function of ischaemic and reperfused tissue, the method comprising administering a composition comprising GLP-1 in a carrier; and (2) a composition for use in the metabolic intervention with GLP-1 as above. The method is useful after surgical procedures selected from cardiac surgical procedures, organ transplants, traumatic limb amputation and reattachment, a ischaemic reperfusion event concurrent with gut infarct and myocardial infarct and improves the function of ischaemic and reperfused tissues. The method is devoid of side effects associated with current procedures. Antigenic and immune stimulating properties are not adversely affected. The present sequence represente a given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glucagon-like peptide-1; GLP-1; GLP-2; metabolic intervention; ischaemia; reperfusion; surgical procedure; cardiac surgical procedure; organ transplant; traumatic limb amputation; limb reattachment; ischaemic reperfusion; gut infarct; myocardial infarct.

The present invention describes a method for the amelioration of brain tissue injury caused by reperfusion of blood flow comprising administering a composition including a compound which binds to a receptor for glucagon-like peptide-1 (GIP-1), in a pharmaceutical carrier. The method is used for amelioration of brain tissue injury is used for metabolic intervention to improve the function of ischaemia. GLP-1 is used for metabolic intervention to improve the function of ischaemic and reperfused brain calls. It treats patients after an acute stroke or haemorrhage and tissue damage arising from a medical procedure that is a surgical event causing ischaemia of brain tissue or a medical procedure involving a reportuation event. GLP-1 is an ideal alternative to insulin for the treatment of stroke as it stimulates endogenous insulin secretion
                                                                                                                      A method for amelioration of brain tissue injury comprises administering a composition including a compound which binds to a receptor for glucagon-like peptide-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        in the presence of normo- to hyperglycaemia but not during hypoglycaemia, thus protecting against the development of severe hypoglycaemia. The treatment optimises insulin secretion, increases brain anabolism, enhancing insulin effectiveness by suppressing glucagon and maintains euglycaemia or mild hypoglycaemia with no risk of severe hypoglycaemia. The present sequence represents a Gila monster venom peptide which is homologous to GLP-1, and is given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Glucagon-like peptide-1; GLP-1; GLP-2; vasotropic; cerebroprotective; brain tissue injury; reperfusion; blood flow; ischaemia; acute stroke; metabolic intervention; haemorrhage; tissue damage; medical procedure; surgical; insulin; hyperglycaemia; hypoglycaemia; brain anabolism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 . match found in sequence:

                                                     Coolidge
This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glucagon-like peptide-1, GLP-1, GLP-2, vasotropic, cerebroprotective; brain tissue injury; reperfusion; blood flow; ischaemia; acute stroke; metabolic intervention; hamomorthage; tissue damage; medial procedure; surgical; insulin; hyperglycaemia; hypoglycaemia; brain anabolism;

activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel formulation (I) comprising an exendin oxexendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which have plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                  Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Type: P Check: 7905

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                        New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Check: 9131
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to: 39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAB11310;
                                                                                        Young A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                      Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose; gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Type: P Check: 9570
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 match found in sequence:
   aabl1309 ; exendin agonist peptide SEQ ID NO 35.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which activity. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                  Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Type: P Check: 9570

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                       New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New formulations comprising an exendin or exendin agonist peptide used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Check: 9145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.
                                                                                                                                                                                                                         Young A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAB11305;
    This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                       Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Check: 9546
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Type: P

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type: P Check: 9476
                                                                                                                                       Type: P Check: 9915

                                                                                                                                                                                                                                                                                                                                                                                                                                             8X3333
                                                                                                                                                                                                                                                This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                       Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAB11300;
                                                                                                                                                                                                                                                                                                                                                           Young A,
This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                       Exendin; agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide used
treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Check: 9061
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New formulations comprising an exendin or exendin agonist for increasing the sensitivity of a subject to insulin to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Type: P

                                                                                                                                                                                                                                                                                       This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   n; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; glucose; gastric emptying; food intake.
                                                                                                                                          New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                      Check: 9520

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which have plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Check: 9486
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Type: P Check: 9081

                                                                                                                                                                                                                                                                                                                                                                                           New
     This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the wensitivity of a subject to insulin to treat diabetes and disorders would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type: P Check: 9578

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the wensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.

                                          New
                                                  for
  This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                     New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAB11290 Length: 39 February 4, 2005 13:32 Type: P Check: 9563 Found using 'seq5' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              aab11291; exendin agonist peptide SEQ ID NO 17.

```
This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel formulation (I) comprising an exendin or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                         Check: 9587

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                              New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Check: 9567

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                   formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Check: 9556
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB11284 Length: 39 February 4, 2005 13:32 Type: P ound using 'seq5' (mohamed337.key)

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin, agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                  formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pil of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                           Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

                                                                                                                                                   Young A,
This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-compolative modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensetivity of a subject to insulful to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                              Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                    New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Type: P Check: 9563
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plasma glucose; gastric emptying; food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      aab11280 ; exendin agonist peptide SEQ ID NO 188

                                                                                                                                                                                                                                                                         This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                            formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes, plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                            Type: P Check: 4098

has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB11277 Length: 35 February 4, 2005 13:32 Type: P Check: 7441 Found using 'seq5' (mohamed337.key)

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                     Exendin, agoniet, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Type: P Check: 6309
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aab11275 ; exendin agonist peptide SEQ ID NO 183.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB11275;
    This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                    This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exendin agonist peptide used it to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                      Type: P Check: 4423
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of a subject

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                          comprising an exendin or exendin agonist peptide used ne sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin, agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              February 4, 2005 13:32 Type: P Check: 7345

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistitity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                        Exendin; agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aabl1270; exendin agonist peptide SEQ ID NO 178. sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New 1
                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                            Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                     New formulations comprising an exendin or exendin agonist peptide used for increaging the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                     Type: P Check: 7002

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the
                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                       New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Type: P Check: 5154

```

```
This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Type: P Check: 7446

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                  New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P Check: 3269
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aab11262; exendin agonist peptide SEQ ID NO 170.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin, agonist, treatment, antidiabetic, insulin sensitivity, diabetes; plasma glucose, gastric emptying, food intake.
                                                                                                                                                                                                          insulin sensitivity; diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Check: 5882

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin or exendin is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Type: P Check: 6326

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB11259;
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ន្តដូច្ច
                                                                                                                                                                                                                                                   This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin, agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                              New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAB11257 Length: 28 February 4, 2005 13:32 Type: P Check: 326 Found using '8eq5' (mohamed337.key)

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
            Exendin, agonist, treatment, antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin, agonist, treatment, antidiabetic; insulin sensitivity, diabetes;
plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                         New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB11256 Length: 28 February 4, 2005 13:32 Type: P Check: 9981

                                                                                                                                                                                                                                                                                                                                                   Young A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to inculin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB11254 Length: 28 February 4, 2005 13:32 Type: P Check: 9965 Found using 'seq5' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin; agonist; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                         New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

 This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
                                                                                                                                                                                                                                                                                                              Exendin, agonist, treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              formulations comprising an exendin or exendin agonist peptide used increasing the sensitivity of a subject to insulin to treat diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Check: 227
